

Orest - Pipeline

Orest runs in three modes across the pipeline: **real-time** (capture), **offline** (processing) and **retrieval/generative** (render).

CAPTURE

Data capturing of rehearsals follows the AMAP principle: collect as much data as possible.

Hardware

- Microphones (ASK Tonkids)
- Cameras (ASK Nils)

Software

- [#TODO]: what is the most effective way of recording all this data in sync?
- [#TODO]: file naming standard

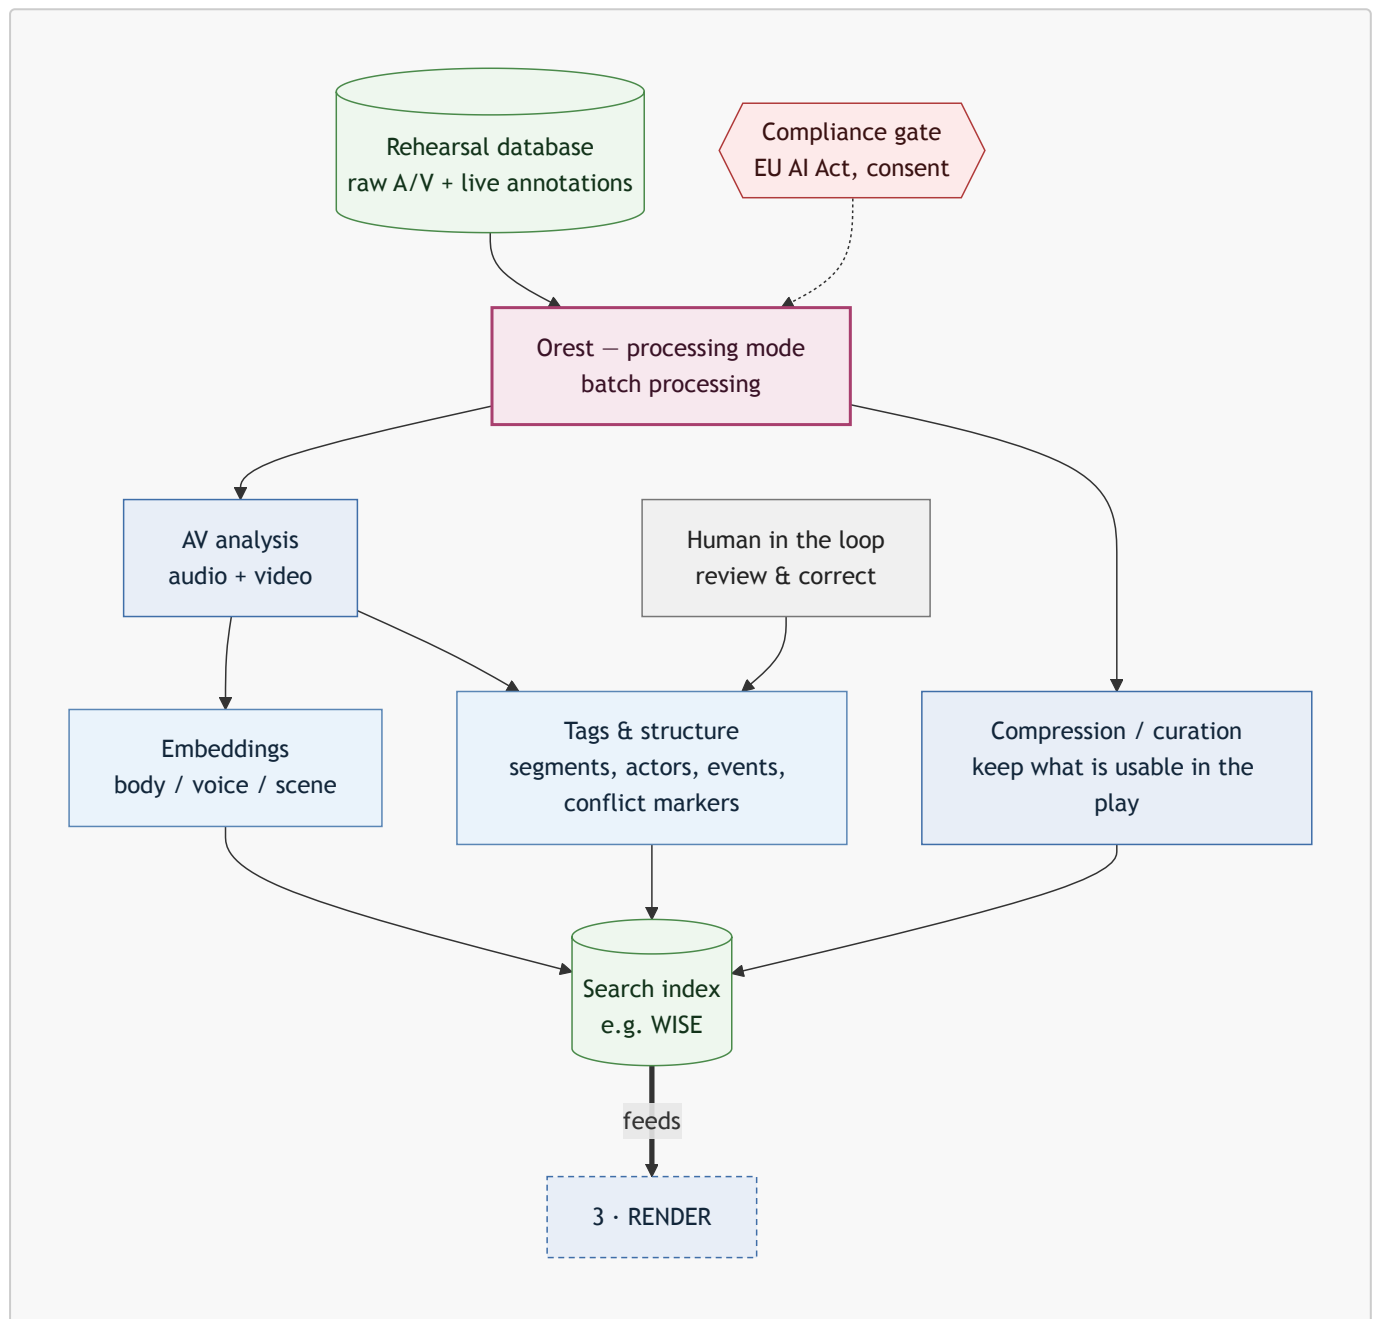

- [#TODO]: database structure
- [#TODO]: Perhaps a tool that allows a human to annotate exact timestamps with a tag during rehearsal?

Anticipating Issues

- capturing third-party individuals? e.g. technicians, AMA, etc. -> perhaps one full-room setup, one stage setup that we can easily switch between
- explicit team-consent?

PROCESSING

Process the rehearsal data to gather intelligence on the room + its activities & participants

Hardware

- PC to run local inference on

Software

- "smart" database existing between capture & processing. Features: annotation during collection, smart search. perhaps use this: [WISE](#)
- profile actors (+ team?)
- compress data, optimising for footage to be used in the play. Current topic focus: teaching the AI to learn how to deal with conflicts by observing human conflict.
-

Anticipating Issues

- EU AI Act for stuff like face & emotion recognition etc.

RENDER

Get material back out of the database — by tag, by body, or by generating something new.
